Description: Deploy an EC2 instance within a VPC and configure an IIS web server to host and serve a web page.

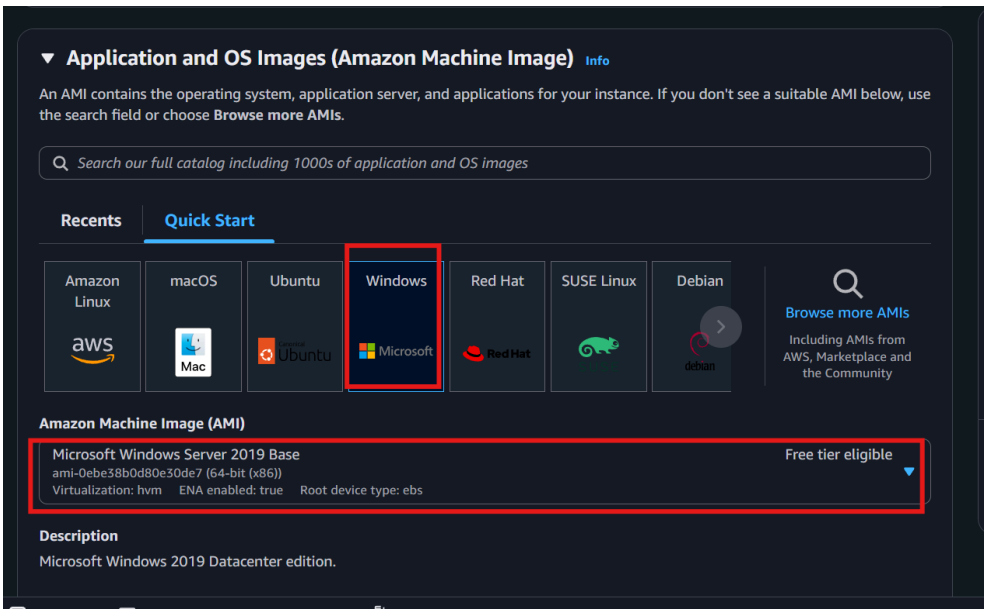

Topology:

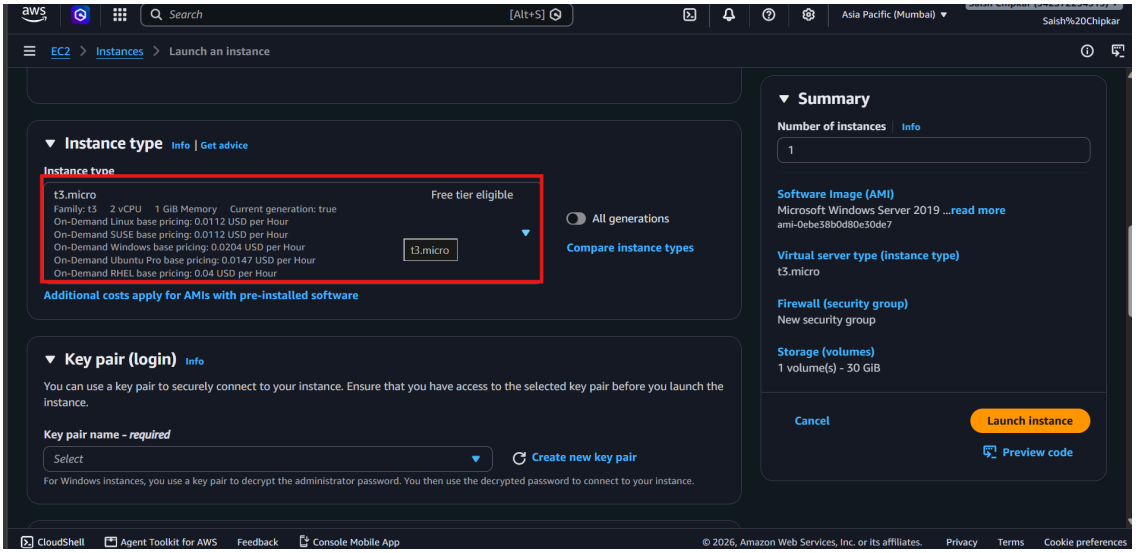

Step 1: Give a name tag to the EC2 Instance

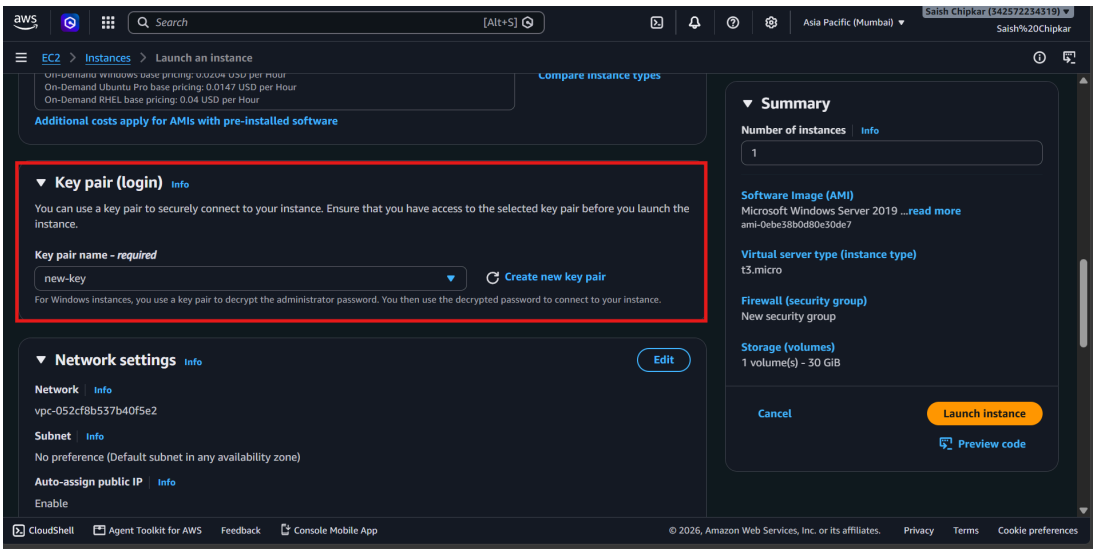

Step 2: Select the Windows OS Image with 2019 Base model

- 

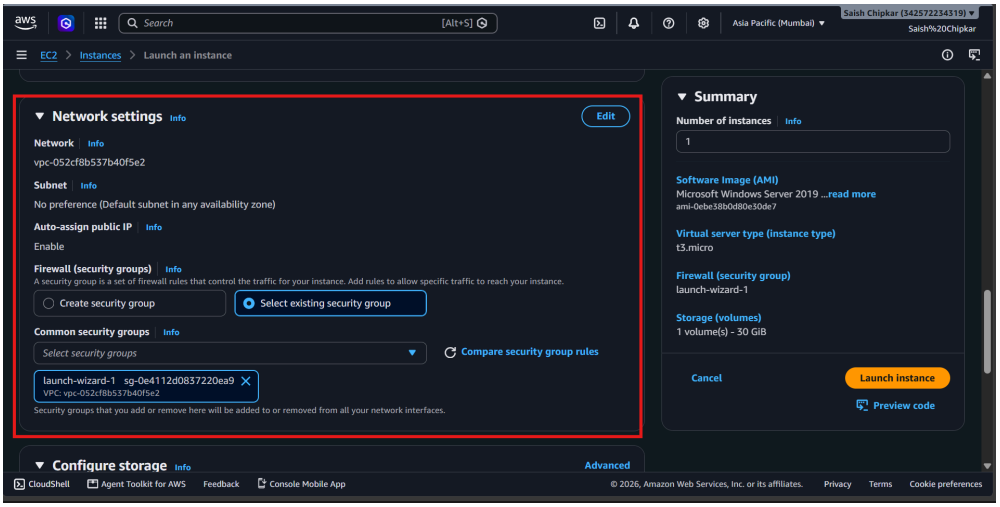

Step 3: Select the Instance type with 2 CPU cores, 1GB Memory,

Step 4: An **EC2 Key Pair** uses a **public key stored on the EC2 instance** and a **private key kept by you** to securely authenticate your login.
When connecting, you give the **private key to SSH**, which proves you have the matching key without sending the private key itself to the EC2 server.

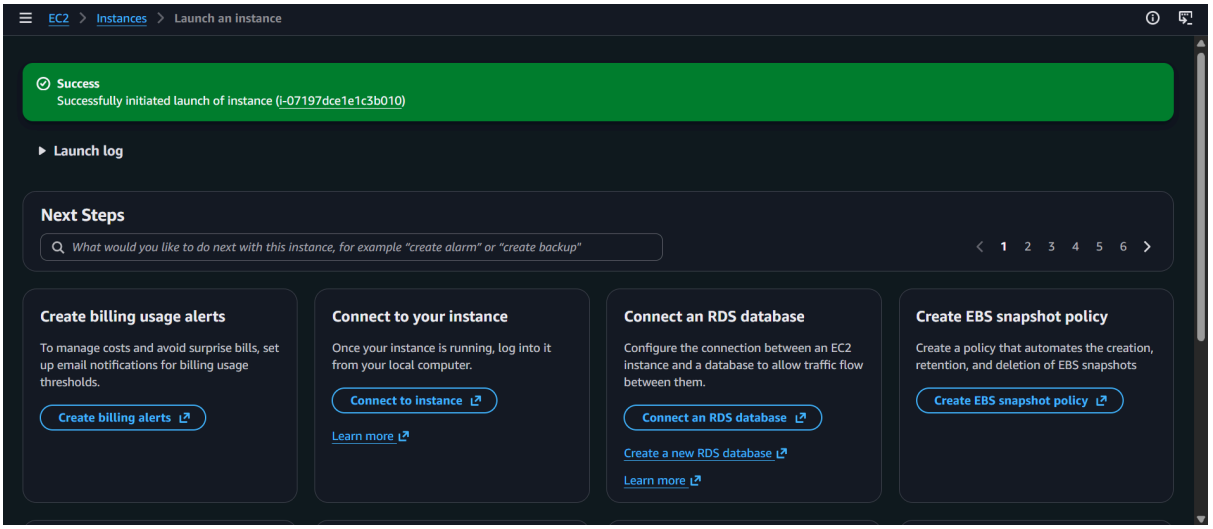

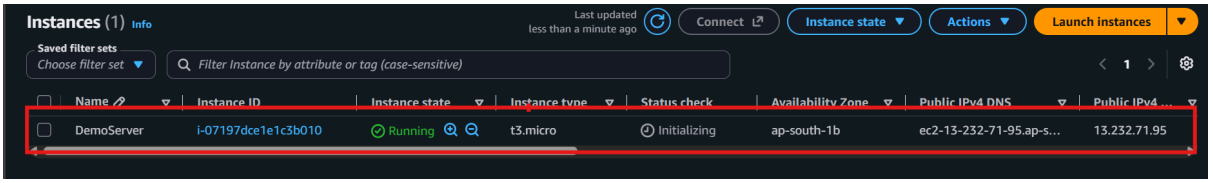

Step 5: Security groups == Firewall is used to control inbound and outbound traffic.

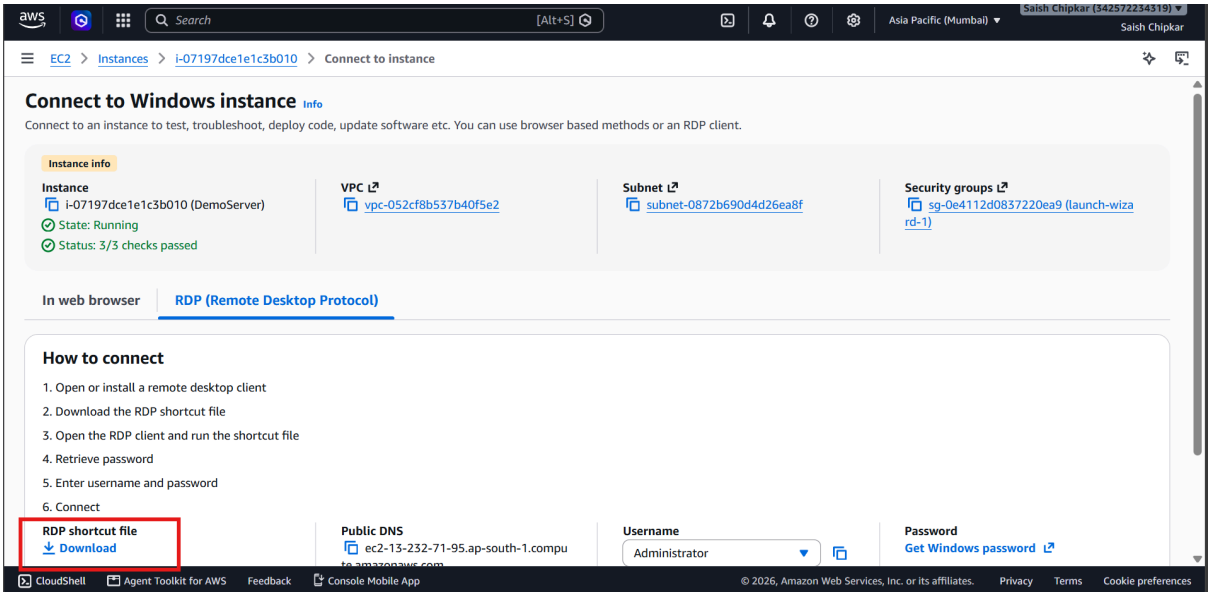

-

Step 6: Launch Instance and choose to connect for this Instance

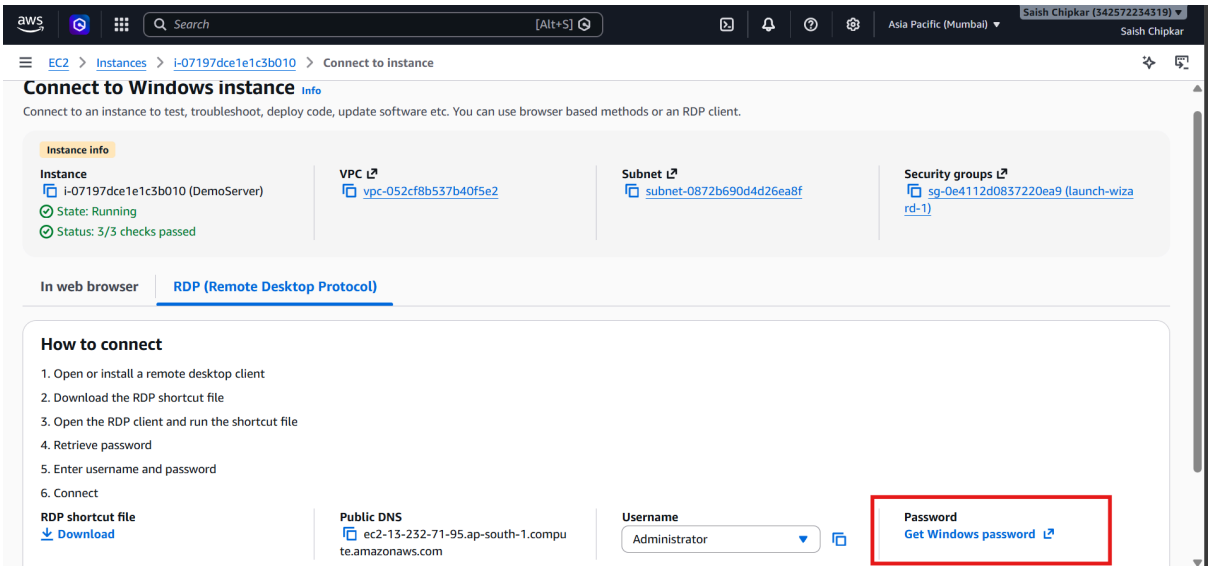

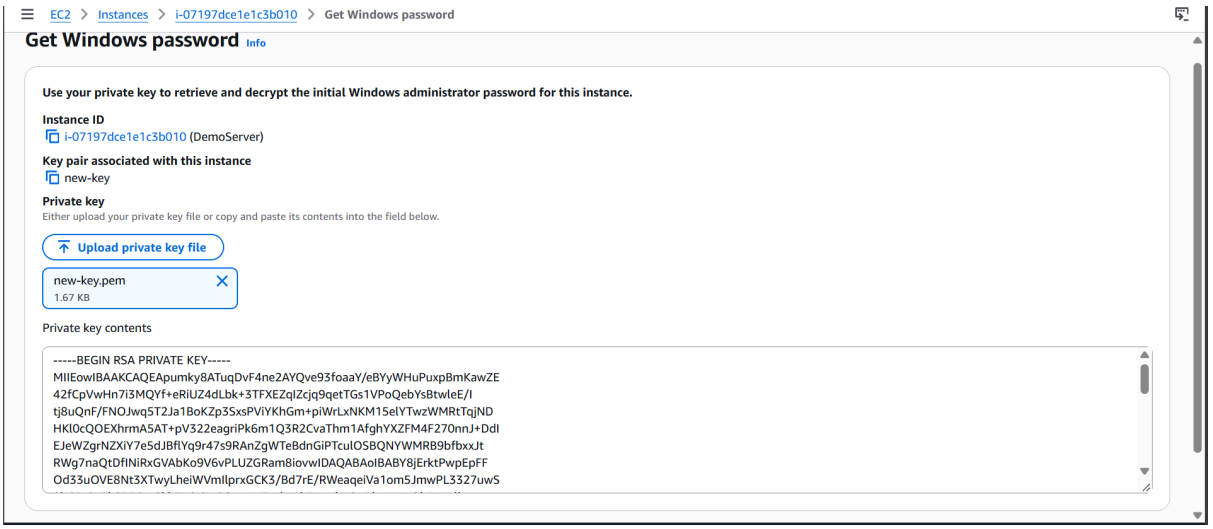

Step 7: Install RDP software

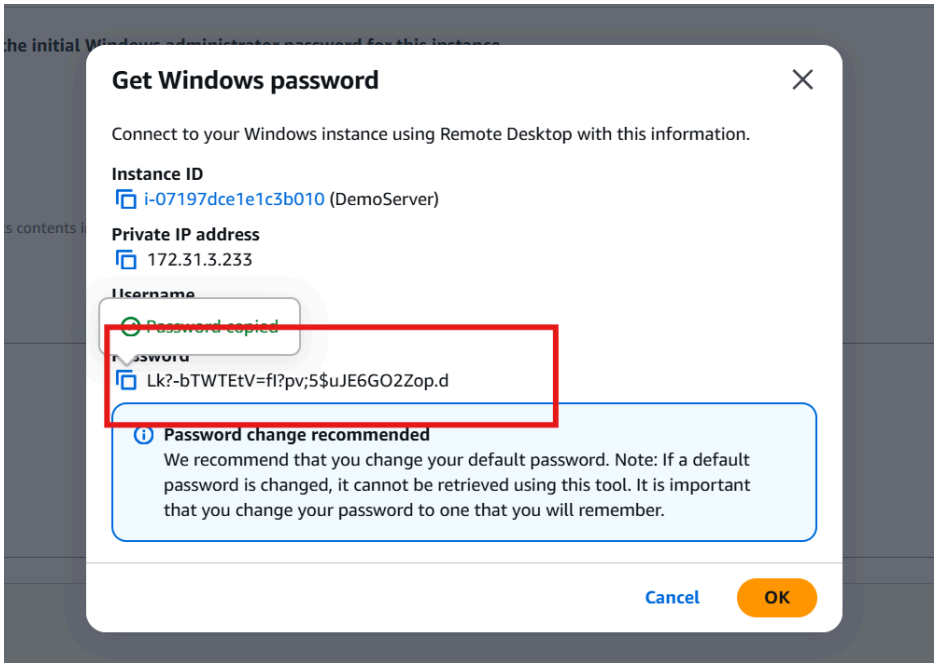

An **RDP shortcut file (.rdp)** contains the connection details needed to connect your computer to your Windows EC2 instance.
You open it with a **Remote Desktop client**, then enter the EC2 **Administrator username and password** to access the Windows desktop.

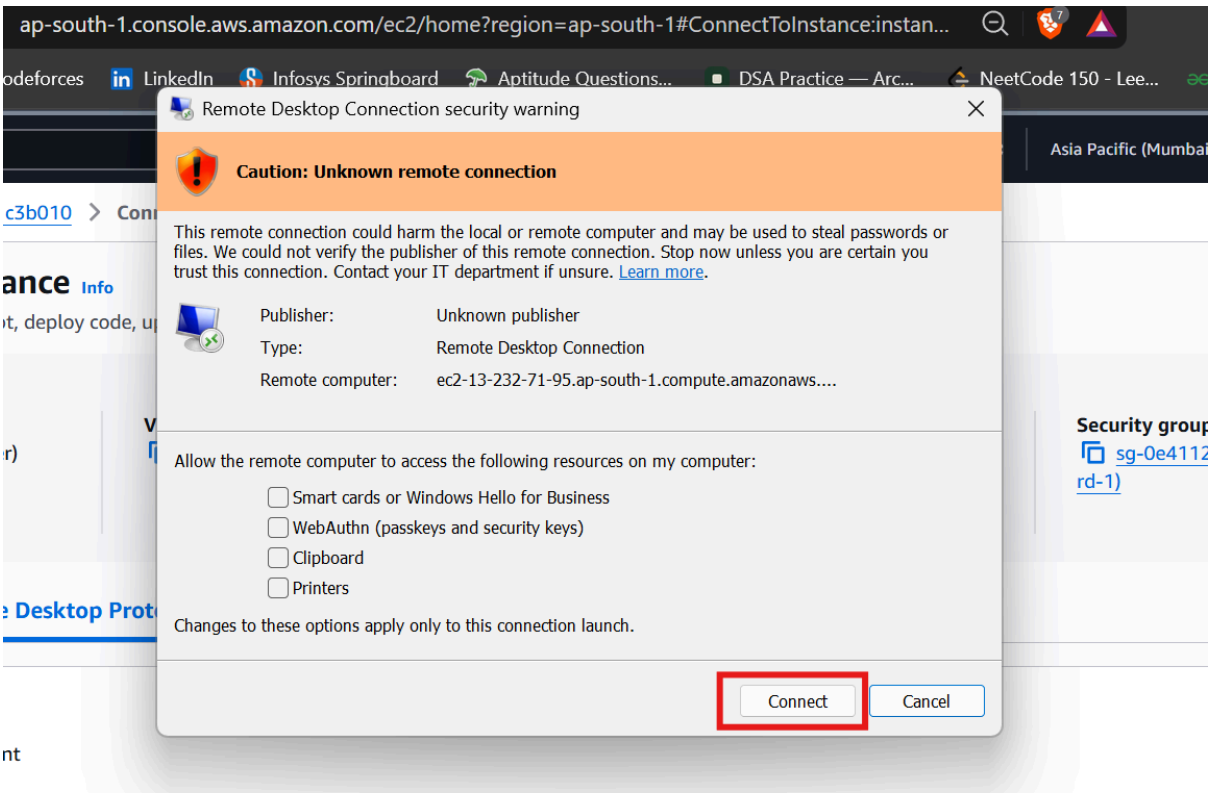

Step 8: Decrypt your private key first from the new-key.pem file before connecting to the instance.

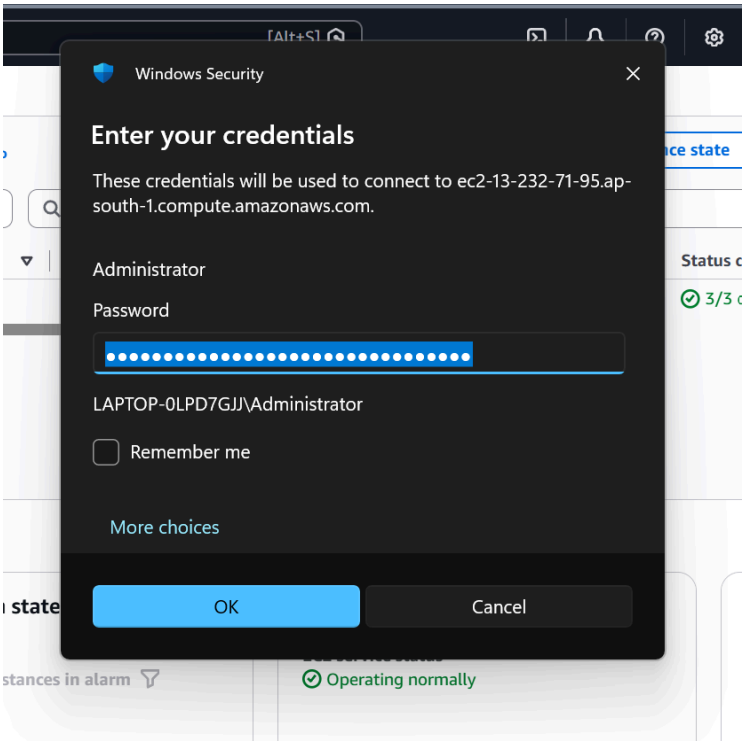

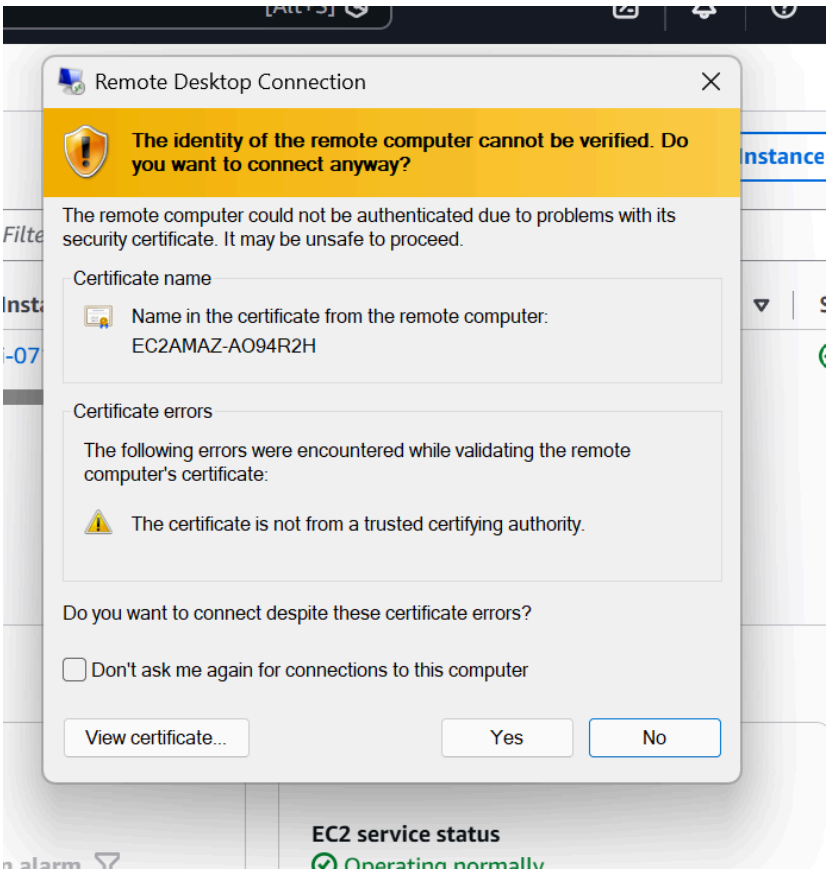

Step 9: Run the .rdp file which we downloaded and enter the decrypted private key password when asked. This is to verify the identity of the us for a particular public key which is present at the aws size to give access to our instance.

Click Yes

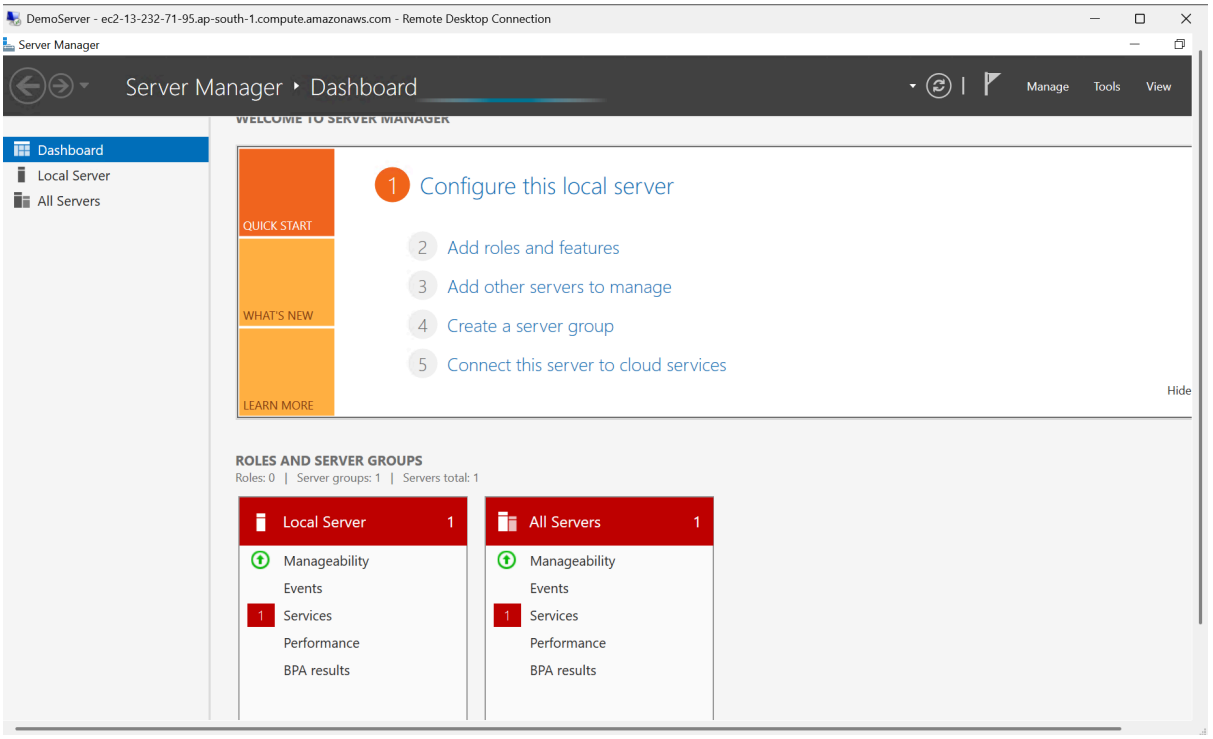

Remote access to the EC2 is done now!!

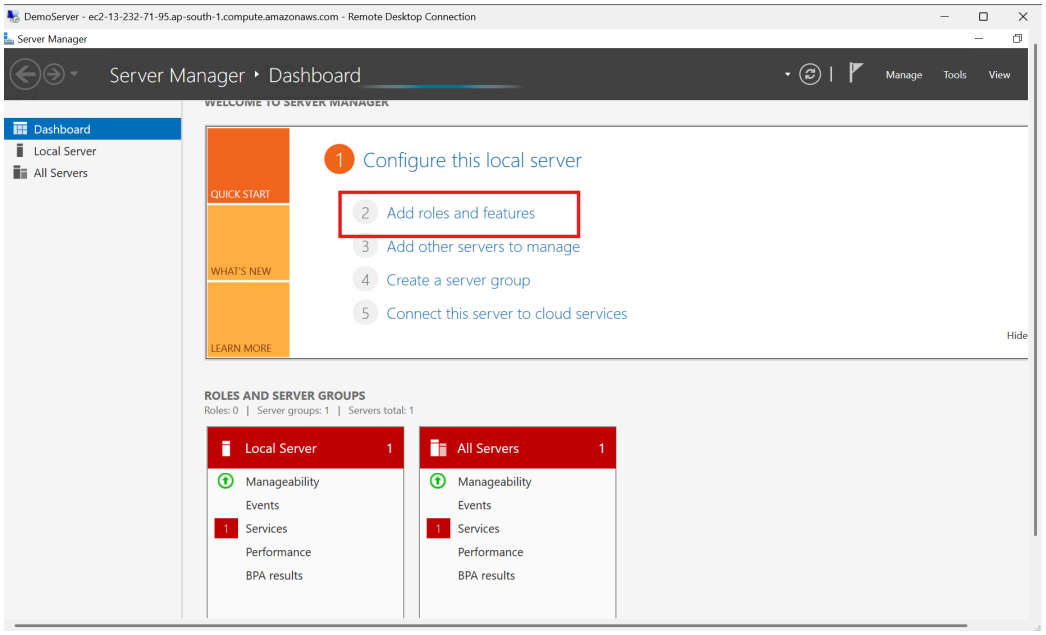

Step 10:
Select the server manager in the Instance

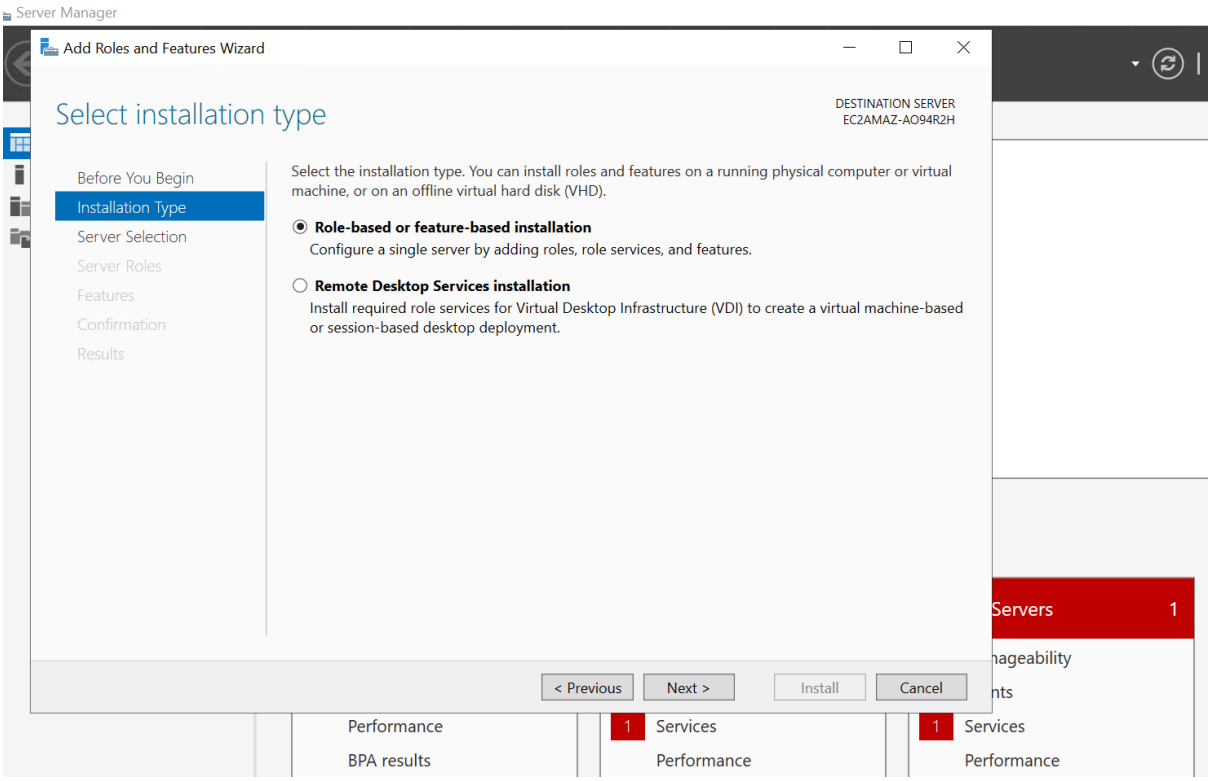

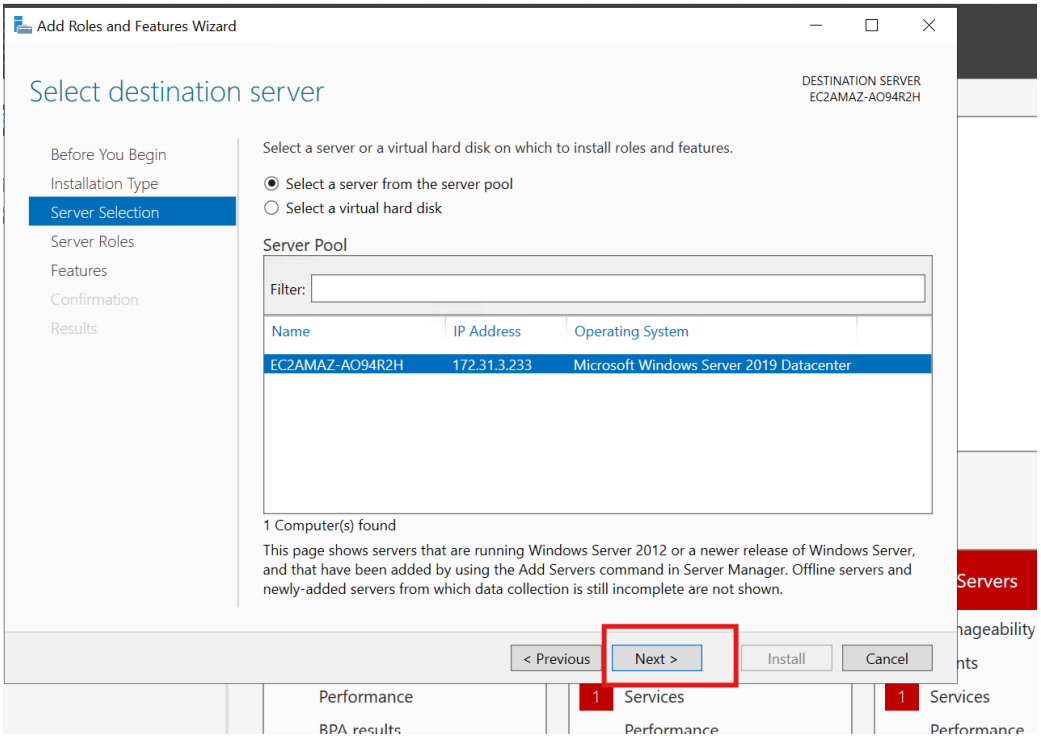

Step 11: Click on the Add roles and features

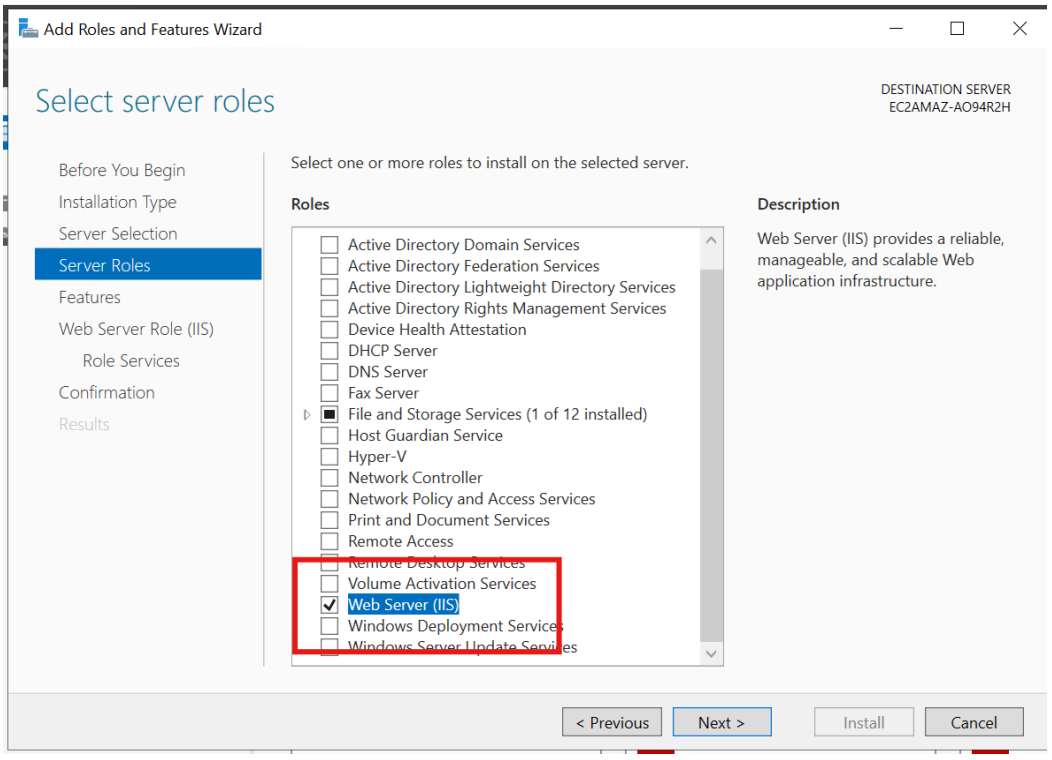

Step 12: Select role based option. Select **Role-based or feature-based installation** because it lets you install server roles and features (like IIS, DNS, or File Server) directly on this EC2 Windows Server.
We choose it because you're configuring **this single Windows EC2 machine**, not setting up a Remote Desktop Services infrastructure.

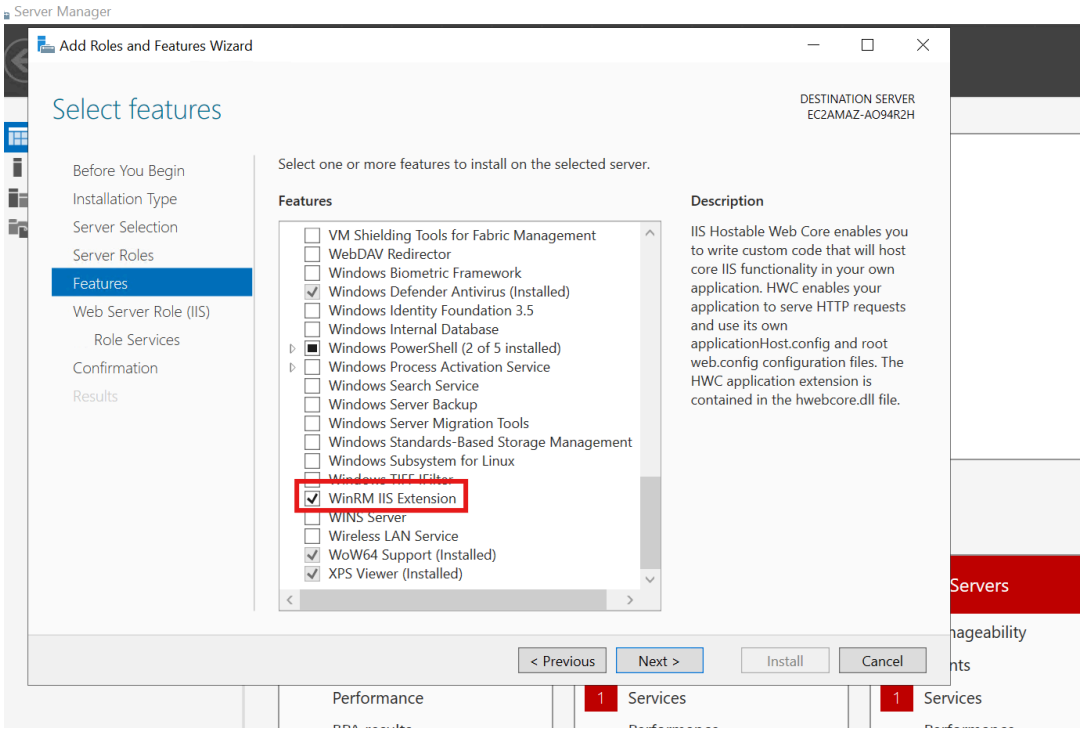

Step 13: Select the default server to install the roles and services.

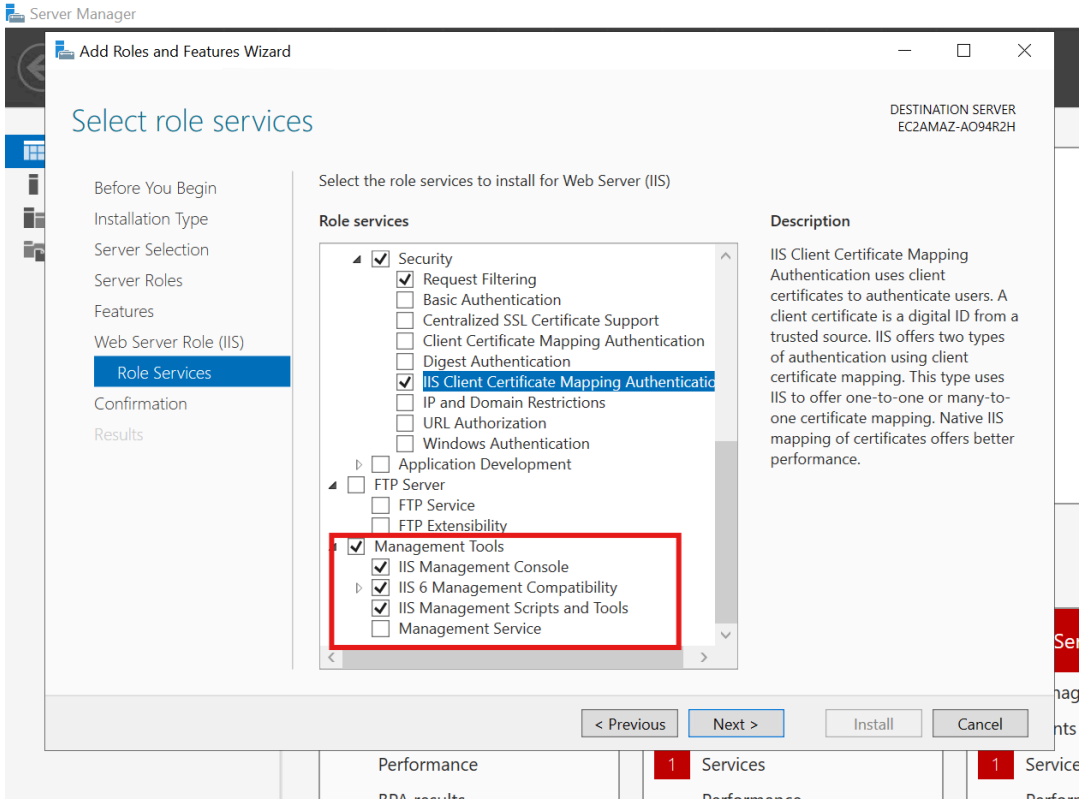

Step 14: Select the service roles and features related to IIS

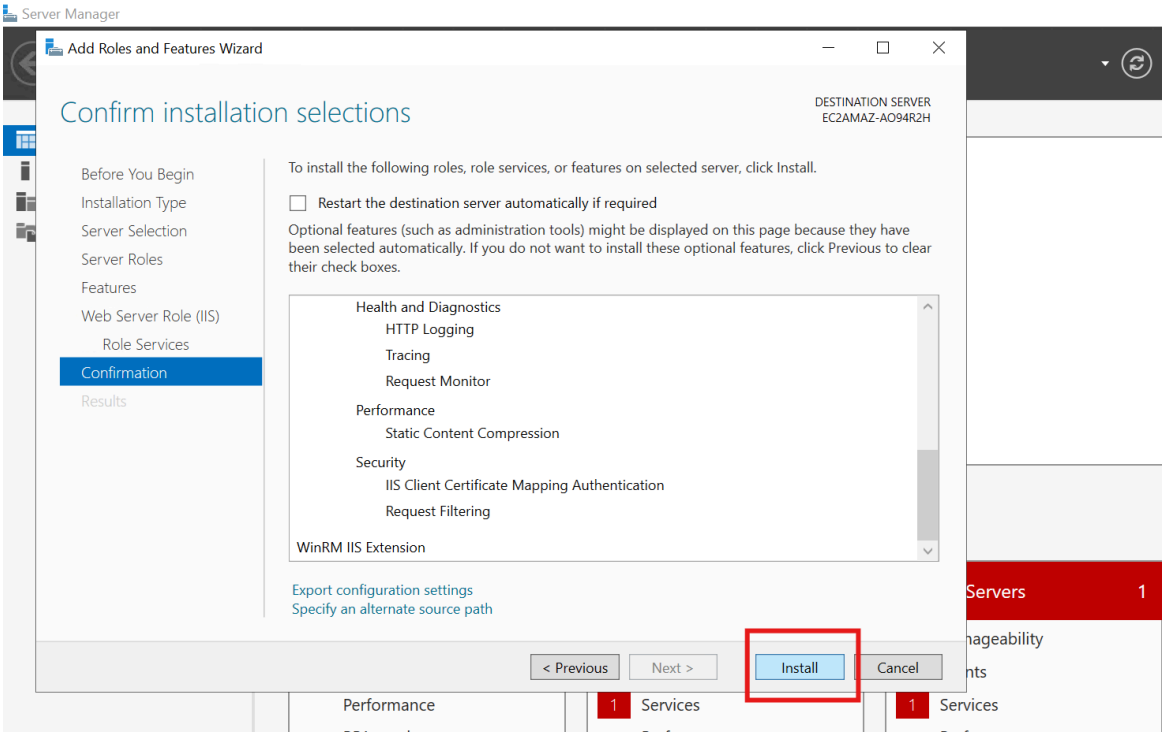

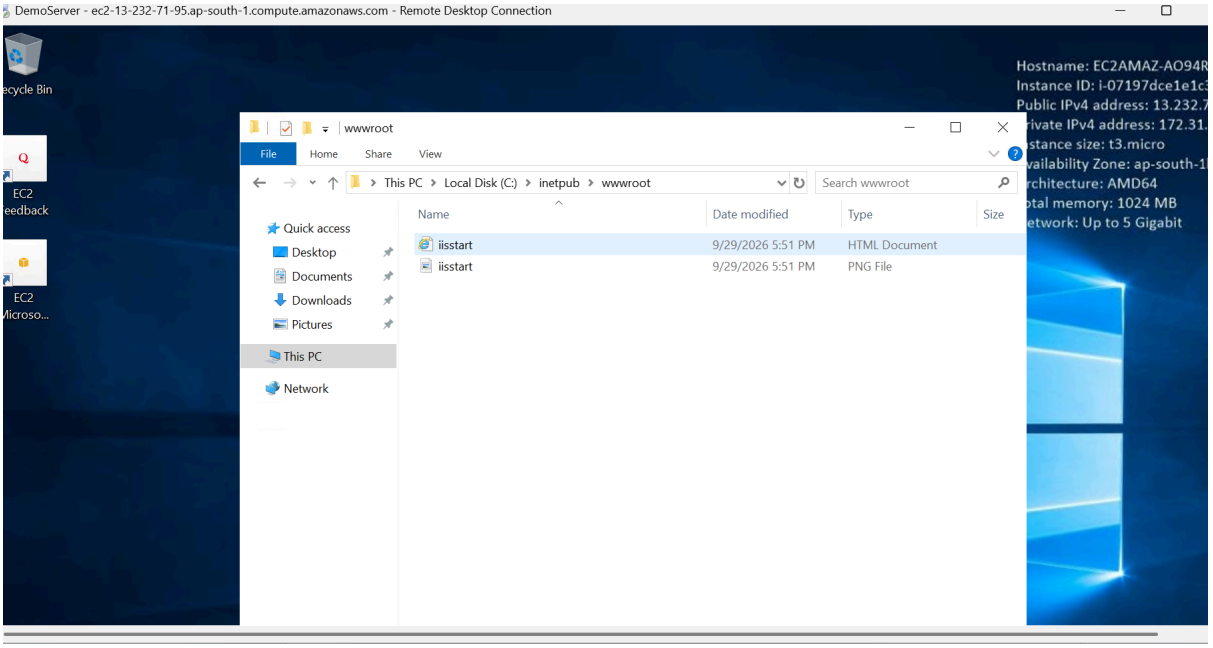

Step 15: Select all necessary role services related to the IIS server

Step 16: Install all the necessary roles and services to make IIS functional server.

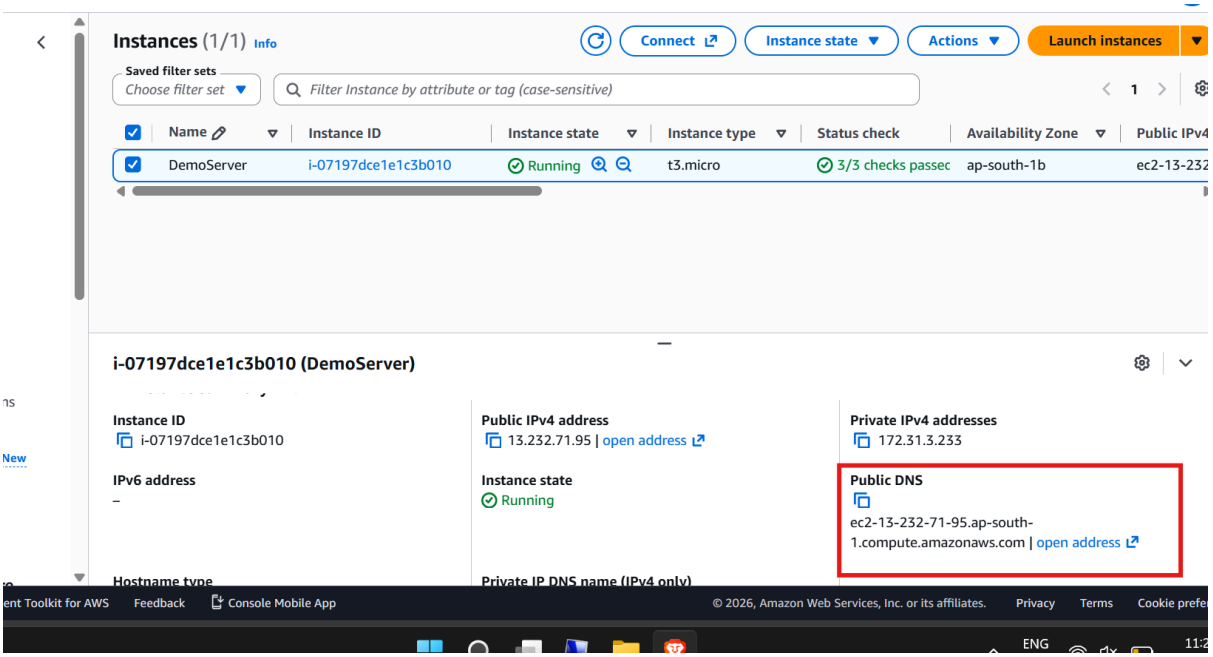

Step 17: Go to the IIS root path to configure the .html files as peer our choice.
Every changes made to the files in this path will be displayed in ouw IIS web server.

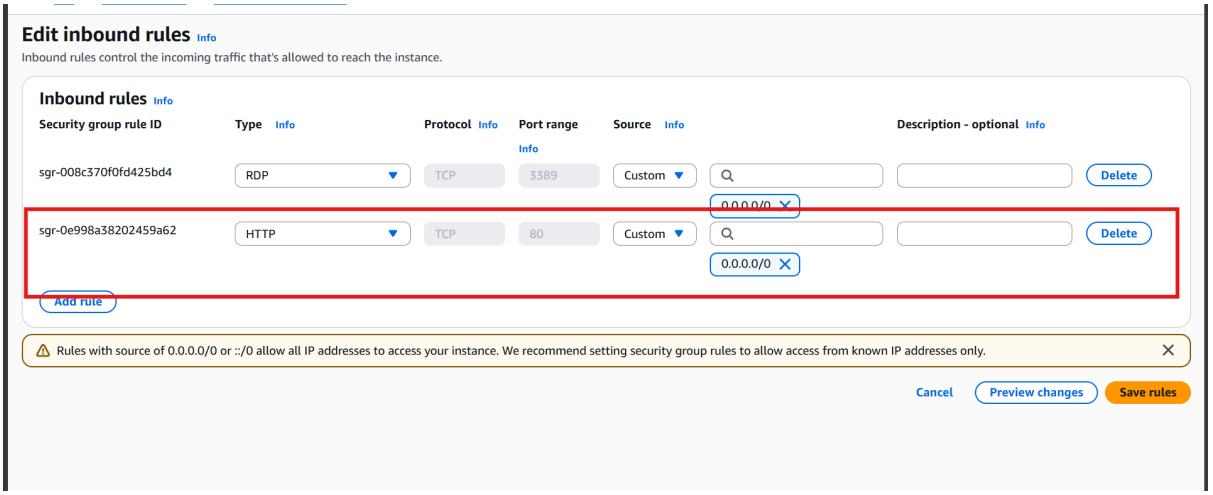

C drive -> inetpub -> wwwroot

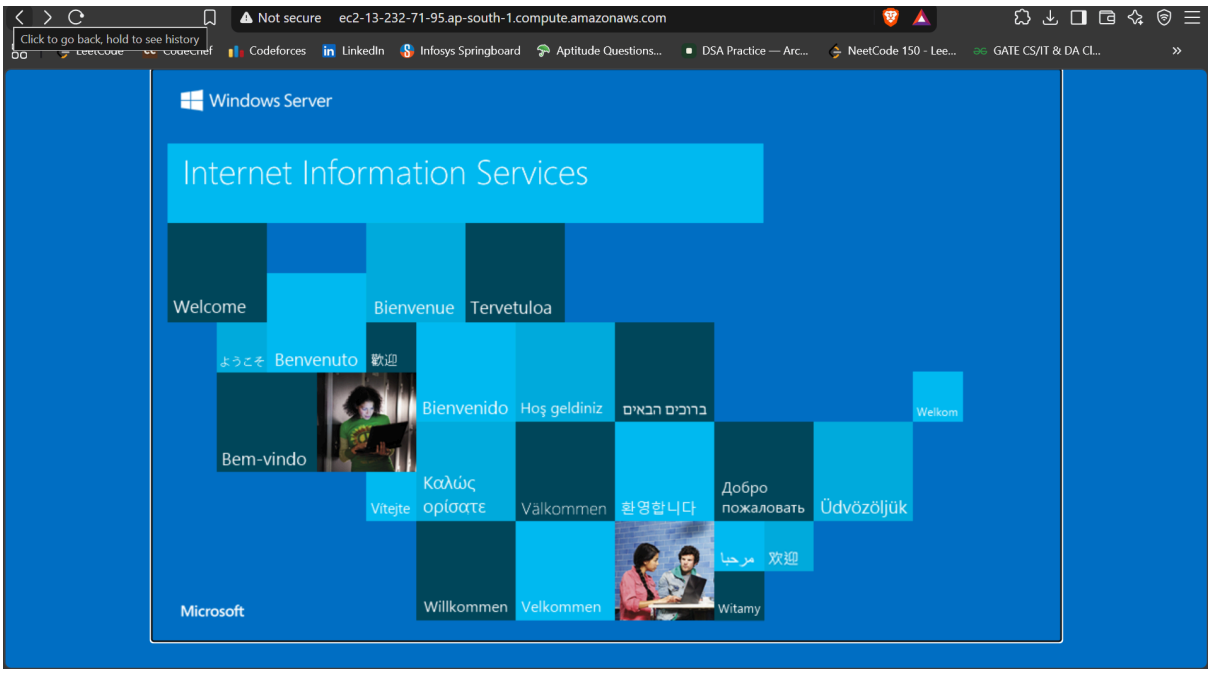

Step 18: Website is displayed in the Instance DNS address

Step 19: Edit the selected security groups inbound rules to also include HTTP request along with the RDP requests(remote access one).

Step 20: HTTP request to the Instance is sucessfully sent.

Step 21: Cerate a file index,html to view it deployed on our IIS server
